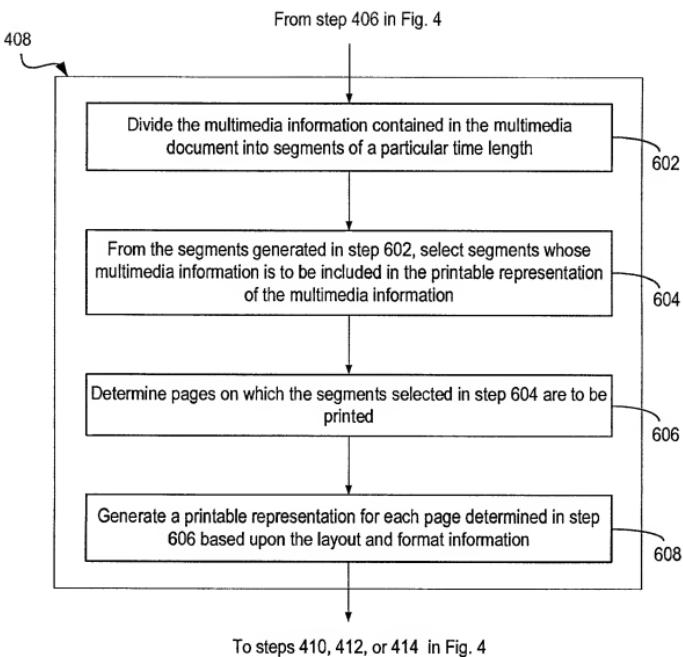

Fig. 6

America.

Joe: that is this a real, I mean this is a real depression based on what NASA picked up by your sensor satellite, right? in realtime that's correct?

Joe: over what amount of time does it take, though?

What we are seeing, these are date that we are -- we are in between march and december of last year. We put them together to make a coherent story.

Joe: gotcha.

About Steck -- degree by 5 degree resolution you can't see individual trees, but you can see where the tree line in west of a sea major routes you can see, that gets caught in tropical east airways carried across Atlantic to South America.

Joe: red spots we've got questions for you, in our live web chat, we'll be right now.

I am a concerned citizen, I have some from us. By that I mean the people of the world. I think we are going to have to negotiate with each other, to clean up each of us clean up the sources, because we are in a global one world, and we have to clean up in areas to us, while e-aught goes to carry.

Just relatively quickly that another question from our web chat just this is from Joe, how does industrial pollution come to natural pollution like the fires you see, and do they now-a-days quickly as it used to be seven?

Industrial pollution, is about half of that total amount of compared to natural sources. Industrial is half or more. From that, about a third of that, I mean, is from manmade sources, such as the fact that are especially popular, to clear forest for agriculture.

We've got another live chat question from the web.

I don't know the answer to that question. Joe: can you believe it. I mean proportion exactly.

We produce a tremendous amounts of pollution, I don't have those figures at my fingertips.

Joe: you would say we are at high end of it I mean are we -- are we one of the world's great polluters, or are other nations.

Sorry I can't hear I can't hear.

Okay, I am going to appear to be having problems with our line, but I will give you appreciate him joining us with insight on that. And now let's take a look at the

SEE ANIMATION THAT SHOWS what the world's air pollution is moving at today's first hot site, provided by NASA. You can get to that site by going to our site, at cnn.com/newsite. Then click on the hot sites button.

PRESIDENT BUSH CONTINUING his visit to California, defended his environmental record today. Using the ancient trees of Sequoia National Park as an example, the President promised to protect what he called "the works of god" for the ages. He announced measures aimed at preserving all of America's National Parks. President Bush today we must seek best ways to achieve the long-term goal leading to a healthy environment, fresh air, water and natural beauty. These policies arise from conviction a healthy environment is a national concern, and requires an active national

Joe: critics blasted Mr. Bush's national energy strategy as largely out of focus on developing new oil sources and more coal and nuclear power, as well.

OFFICIALS IN CALIFORNIA are hoping a new power-generating plant will help ease some of the power problems in the southern part of the state. The new plant is being pressed into service one year ahead of schedule. CNN national correspondent Frank Sesno rode in from Hemet in Riverside County, California, with more on the story. Frank, I wonder if you hear me sounds noisy in there.

It is very noisy. In here, this is the sound of pumps being turned on, as the water pumping station numbers this as an area used for pumping water, today, four of the pumps have been converted into turbines to help generate electricity. Let me show you exactly how that is being done. This is a video tape showing the Lake Hemet and Valley Lake that is a massive lake, 860,000 acre feet of water that water, mostly pumped to that location from the Colorado River aqueduct, that is how the water gets to this location. That water is finally pumped into the lake, and from the lake, it is used for future use. The process is being reversed today, the water coming back down from the reservoir, through these pumps which have been converted into turbines, and then the water goes through these turbines electricity is being generated let me step outside, here now and show you where that water ends up as it passes through and underneath where we were just standing it passes through here, it is being sold and that reservoir, and from here, the water goes into the San Diego canal and goes on to some of the customers in Southern California who use it. This is Phil Pace the chairman of the Hemet Valley Water District. Phil, tell us about generating here at this pumping station.

Our initial program right now, that returned -- turned on four pumps converted generate 13 megawatts of power which is translates to enough power to accommodate 13,000 homes for one year. And that is what the initial program is

Fig. 7B

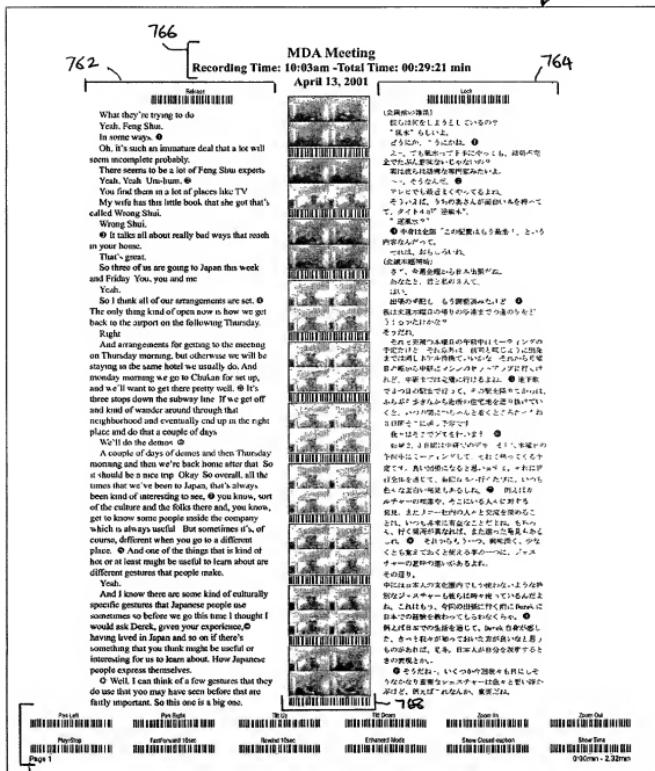

Fig. 7C

800

802

presenation

How would you give the video though?

man

That's a good point.

Would you have to -- mean, if you want it to be appliance-like, you want it to -- you don't want the other person -- the person who comes in here and plugs their laptop into our display to know that they should have to configure anything special.

Or install anything.

Or install any software on their PC?

And to be plugging in microphones and stuff so it seems a projector is already under your control you have a good opportunity to do something with that.

So one thing to do is to grab the video stream, stuff it into a file and then pick file or something. I mean, there's a possible way to solve the problem, but then you need to capture audio to go along with it to make it more lively. You know what, it's just like everything else, it's a software requirement that you have to do that.

Yeah, it's a long way.

Video stream is what? It runs what, a gigabyte per hour, two gigabytes per hour?

Yeah, two gig per hour for MPEG2.

meaning, if you have a two gig hard drive you can just grab the relevant frames for the slide. So you don't need a full video.

Then you look at the (transferees).

Right.

And every time it's different frame.

That's a great idea. That's wonderful. And that way you wouldn't have to save the whole video, just the frames when they change. I bet you would have a lot of advantages.

So how would you put them together. I mean if you have the audio and have these frames, how do you synchronize them because you would have presumably an easy way to play it all back, right?

Yeah, exactly.

And MPEG -- at the moment MPEG doesn't provide for that, the current MPEG 1 and 2.

Yeah, it's just a mess of frames together with an audio.

So that's some sort of mixed file.

Well, with every frame you grab you get a timestamp, and then you can generate a slide file, where you have timestamps --

What's a SMIL file?

A SMIL file is a -- it's something that

806

RealPlayer supports so you'll be able to play by the status track synchronized with time stamped images.

That's our way of synchronizing metadata with video is with SMIL.

Yes.

Very interesting.

Then it would be just like a slide show, wouldn't it?

Yeah, Yeah.

Just like individual frames appearing in time where they originally appeared.

It would just look like a video.

That's great.

That would be very nice.

It's a good way to do a presentation. And then if you have a SMIL format set up, I bet you could even stream that presentation, couldn't you? You could probably set it up so you have a computer in the office a central server that generates all your presentations and then makes them available later for retrieval on the web. That would be great.

Yeah. You definitely want to be able to do that.

Yeah. And actually if the original slides are taken from PowerPoint presentations, then the text probably appears very sharp in the image, and I bet you could edit that pretty well.

Yeah.

And then index that for retrieval with a full text search engine and then the presentation would become a document inside the eLibrary.

Yeah.

That's a great job.

It creates time stamps too. I mean the white board captures stuff that you've done. You keep time stamps.

Or (finalistic) time stamps.

So again you can synchronize this with white board data and stuff so thus is perfect for the movie tool.

That's wonderful, yeah.

Then, I have these resources. These are the kinds of things I went to put together visually.

I believe in the movie that you could show while board being replayed at the same time when as the presentation was being captured.

I think that's the goal.

The video in the meeting, yeah, it would be great. Excellent idea. Okay, I think we just need to go back to the first slide.

What are we going to call it?

The presentation recorder appliance.

804

Page 4

Fig. 8A

902

the majority of people here who are negative. 30% of actually active adults are H.I.V.-positive. For the population as a whole, the number is about 20%.

Reporter: to that end, rapid testing centers like this one are being set up around the country. Young health workers are also going out into the community to encourage people to get tested. A program called "Total care" is being implemented. The goal is to reach every household in Botswana. The man who was the main target of the program has already heard about it. He politely knew most questions, but when asked, he understood the dangers of aids, and then left to take his cattle to water. He told us he knows aids like a dog, using a condom is what he does, but his friends don't.

Reporter: the government is also actively working to stop the transmission of the virus from mother to child, which happens in the胎盤 (胎盤) womb.

Wolf: approximately 60,000 deliveries occur each year. Of these, 40% of these women are H.I.V.-positive, so we have 24,000 H.I.V.-positive mothers giving birth each year. The risk of transmission from mother to baby is around 40%, so that gives us 9,600 babies who are born each year with H.I.V. infection.

Reporter: the main hospital in Francistown has a program to give anti-transmission drugs - zidovudine or a Z.T. - As part of a pilot program for the past two years, they've been giving the drug along with help from the nongovernmental organization (NGO) UNICEF. Lono Maphatini is the doctor in charge of the National mothers-to-child program. So when is your plan to have it available to mothers throughout the country?

Wolf: We are working on a target of December 2001, and so far, we have covered seven districts out of 24 health districts, so we still have a long way to go.

Reporter: He said they also have a long way to go in getting a women to agree to be tested. Did you decide to get tested for H.I.V./AIDS?

No, I didn't.

Reporter: Why not?

5 I don't want to frustrate myself.

Reporter: You'd rather not know?

Yes.

Reporter: Why?

If I know, I can kill myself, so I don't want to know.

Reporter: So even though it's possible that by not knowing, you're transmitting it to the baby, you still don't want to know?

903

904

905

906

907

No, I don't want.

Reporter: nearly all the women in the program want - we're asked to test in these houses - also refuse to be tested. They said if a mother has H.I.V., a doctor will tell her not to breast feed. Then families and neighbors will know she tested positive, and because H.I.V. is transmitted through breast milk. To deal with these concerns, the government announced late last month that it will give an anti-transmission drug to all women to want it at the time of giving birth, whether or not they have been tested. That way, if the woman doesn't have the disease, she may end up taking the drug, but the consensus was that the risks outweighed the benefits. But these mothers raised yet another concern. The drug is to save the baby, not the mother.

908

It doesn't make much sense to save the baby and let the parents die.

Ruthie Patricia Bakwena runs a volunteer organization that works with children of AIDS victims.

We used to protect the unaided families, but now we've decided families are interconnected, so we've got to help them. Some of the people, the relatives who are left with the children, are dying themselves. And finally, the whole family gets wiped out.

(Singing) 910

Reporter: these are some of those children. They sing, "my mother died before I could even see her face."

(Singing) 910

The kids are part of a program called shuning school, which Patricia Bakwena and a group of volunteers have set up on the edge of Francistown with some help from the U.S. Embassy. Most of the kids are orphans. The rest are what she calls "vulnerable children". Some of the vulnerable children are those children whose parents have tested positive, but they're still alive, and they want their children to be prepared for come what may. Every day, we have people bringing in children.

For Title: _____ Author: _____ Date: _____ Page: _____ Format: _____ Show Details: _____ 80% - 100% 24 15min 35 3hr+1

Page 6

Fig. 9A

900

the majority of people here who are negative 36% of sexually active adults are HIV-positive in our population as a whole, the number is around 20%.

We want to keep the 80% of the general population who's HIV negative, we want to keep them that way. The key is knowing your status.

Reporter: so that end, rapid testing centers like this one are being set up around the country. Young health workers are also going out into the community to go in and test people as part of a program called "rapid community mobilization." The goal is to reach every household in Botswana. The man who was the main target of this program, already has AIDS. He politely unanswered questions about whether he understands the dangers of aids, and then left to take his cattle to water. He told us he knows aids, and is using a condom when he has sex, but his friends don't.

Reporter: the government is also actively working to stop the transmission of the virus from mother to child, which happens in the other 10% of cases.

Well, approximately 60,000 deliveries occur each year. Of those, 40% of those women are HIV-positive, so we have 24,000 HIV-positive pregnancies occurring at any one time. The rate of transmission from mother to baby is around 40%, so that gives us 9,600 babies who are born each year with HIV infection.

Reporter: the main public hospital in Francistown has been running an anti-transmission drug, named zidovudine. As part of a pilot program for the past two years, Botswana got the drug cheaply with help from the manufacturer, Glaxo Smith Kline, and USAID. The government has a program of the Namibian model, to child program. So when is your plan to have it available to mothers throughout the whole country?

Well, we are going on a target of December 2001, and as far as we have gone, we have seven districts out of 24 health districts, so we still have a long way to go.

However, he said they also have a long way to go in getting women to agree to be tested. Did you decide to get tested for HIV + AIDS?

No I didn't.

Reporter: why not?

I don't want to frustrate myself.

Reporter: you'd rather not know?

Yes.

Reporter: why?

If I know, I can kill myself, so I don't want to know.

Reporter: so even though it's possible that by not knowing, you're transmitting it to the baby, you still don't want to know?

No, I don't want.

Reporter: after all the women in the program were, we asked her to go to have her blood tested, she refused to be tested. They said if a mother has HIV, a doctor will tell her not to breast-feed. Then friends and neighbors will know she tested positive, and because HIV is transmitted through breast milk. In deal with these concerns, the government announced late last month that it will give an anti-transmission drug to all women to want it at the time of giving birth, whether or not they have been tested. The main concern now is who doesn't have the disease may end up taking the drug, but the concern was that the risks are outweighed by the benefits. But those mothers raised will another concern. The drug is to save the baby, not the mother.

Reporter: so if a woman why not breastfeed if she is not protected?

So many one who is supposed to take care of that baby.

What about if she is sick?

It doesn't make much sense to save the baby and let the parents die.

Reporter: Patricia Baluswanyi runs a children organization that works with children of AIDS victims.

We used to depend on extended families, but now the extended families are overextended and so on. Some of these people, the relatives who are left with the children, are doing themselves. And finally, the whole family gets wiped out.

(Singing.)

Reporter: these are some of those children. They say, "my mother died before I could know her. My mother died before I could even see her face."

(Singing.)

The kids are part of a program called "slamming" time, which Patricia Baluswanyi and a group of volunteers have set up on the edge of Francistown with some help from the U.S. Embassy. Most of the kids are orphans. The rest are what Baluswanyi calls "surviving children." Some of these children are the children of those children whose parents have tested positive, but they're still alive, and they want their children to be prepared for come what may. Every day, we have people bringing in children.

America.
Joe that is this a real. I mean this is a real depiction based on what NASA pieced up by your satellite, right? an animation
That is correct.

Just over what amount of time does it take, though?

Joe we're seeing, these are dates that we are were taken between March and December of last year. We put them together to make a coherent story.

Joe gothic.

Also, it's a degree by 5 degree resolution you can see that gets caught in tropic east drifts carried across Atlantic to South America, then reflected off the Andes and then off, in our live web chat underway an web right now, I think the correction probably has to come three or four. By that I mean the peoples of the world. I think we have to have negotiate with the peoples of the world to help [redacted] the interests, because it we are as a global one world, while one might goes to Europe.

Joe rephrase quickly that another question from you, I mean, I mean, I mean from you, how does industrial pollution come to be at [redacted] pollution like forces fire great point do they move as quickly as we see?

Industrial pollution is about half of that total amount of compared to natural sources Industrial is half or more. From that and by a industrial, I am including industrial sources, I mean, these forces are especially unique, to each force for signature.

We've got another live chat question from the web

I don't know the answer to that question Joe can you balance it, I mean proportionality

We produce a considerable amount of [pollution] I don't have these figures at my fingertips.

Joe, you would say we are at high end of it I mean are we - are we one of the world's largest polluters or other nations

I can't find it I can't find it

Okay, we appear to be having problems with our live to John gallagher we appreciate him joining us with weight on that And now let's take a look at the.

PRESIDENT BUSH CONTINUING his visit to California, defended his environmental record today. Using the sunset tree of Sequoia National Park as a backdrop, Bush said he was determined to protect what he called "these works of god" for the ages. He announced "measures aimed at preserving all of America's national parks." President Bush today we must seek best ways to protect the environment, according to protect a natural area of clean water and natural beauty. These policies arise from: conserving a healthy environment is a rational concern, and requires an active natural

Joe critics blasted Mr. Bush's national energy strategy in large part because of focus on developing new oil sources and more coal and nuclear power, as well.

OFFICIALS IN CALIFORNIA ARE helping a new power-generating plant will help ease some of the power problems in the southern part of the state. The new pump storage plant is due to service in early stages of schedule. CNN International correspondent Frank Buckley, joins us from Hemet in Riverside County, California, with more on the story. Frank, I wonder if you hear anything about the new power plant.

It is very noisy. In here, this is the sound of electricity being generated at the water pumping station, normally this is an area used for pumping water, today, for the first time have been converted into a power plant to help [redacted] let me show you exactly how that is being done if you go outside we can show you Diamond Valley Lake, that is a lake that is located about 9000 feet and of water that was originally pumped to that location, from the Colorado River aqueduct, that is how the water gets to that location. Then it is sent back pumped into the lake, and that water must be available for use. The process is being reversed today, the water coming back down from the reservoir through these pumps which have been converted into turbines, and in that it passes through those turbines, it is being converted into [redacted] me step outside, here now and show you where that water ends up as it passes through and underneath where the water is standing in one concrete reservoir, into the water in this reservoir, and from here, the water goes into the San Diego canal and goes on to some of the [redacted] in San Diego, for who use it. This is the power plant the chairman of the Metropolitan Water District Mr. Pace Tell us about generate heat at this pumping station.

Our pumping program right now returned -- now on four programs right now, that returned -- on four programs right now generated 13 megawatts of power which it transmits to enough power to accommodate 13,000 homes for one year. And that is what the initial program is

Fig. 10

Fig. 11

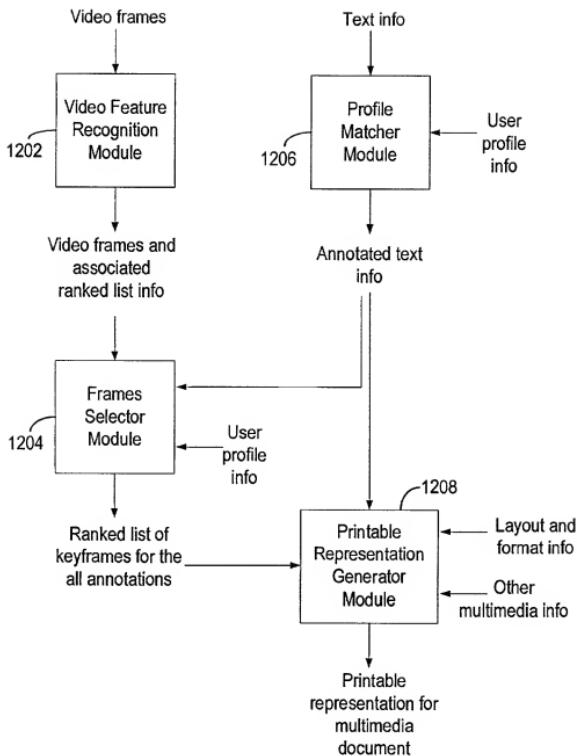

Fig. 12

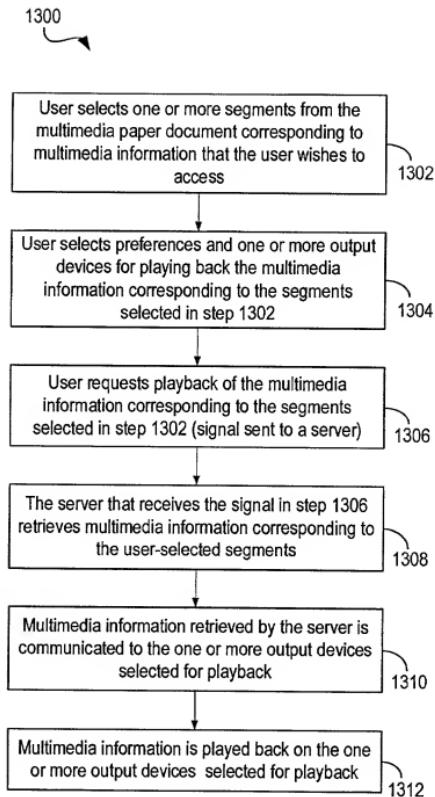

Fig. 13A

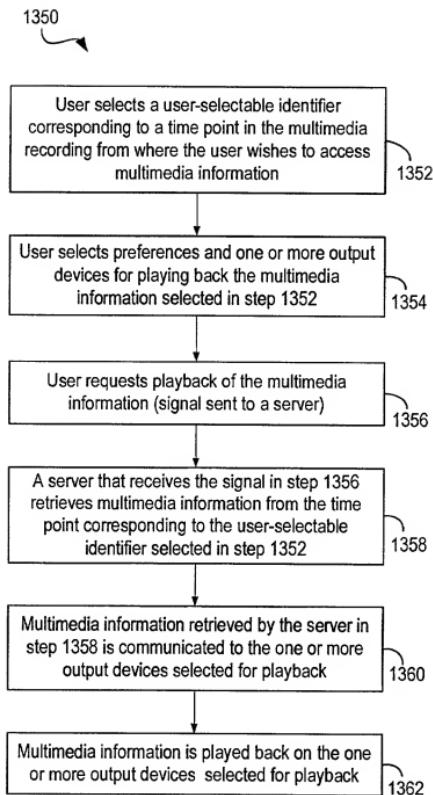

Fig. 13B

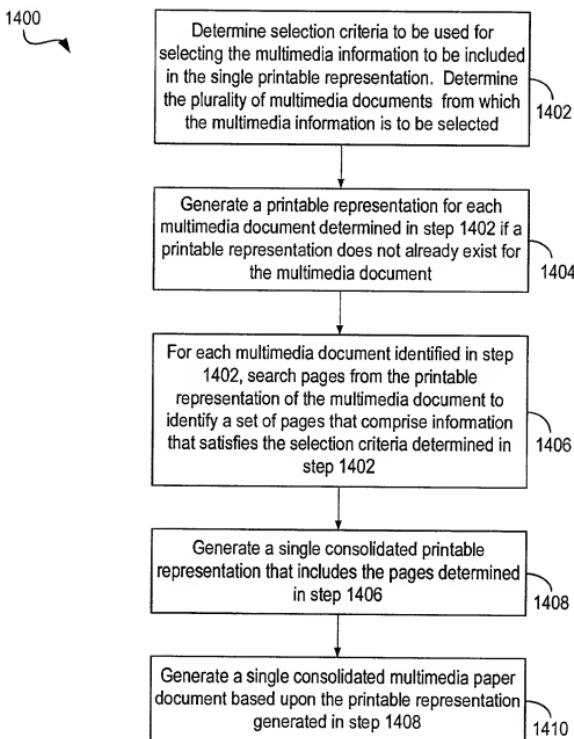

Fig. 14

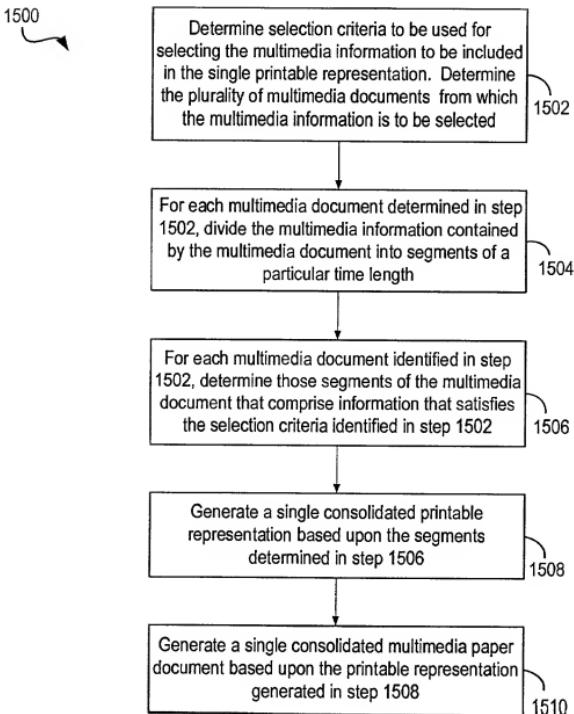

Fig. 15

And eventually you will have more pumping converted into turbines and 40 megawatts, eventually.

That's a 12 pump facility so when we get on-line with all of them we will be able to generate enough power for 45,000 homes. And that's in addition to our conservation programs and some other things we are doing. We are asking California to shut off our pumping plants along Colorado River aqueduct when power is needed will generate about 150 megawatts of power from the Colorado River aqueduct.

And you had to accelerate programs of these to accelerate the conversion of pumps into turbines if it happened to take another year. I finally, we planned to do it in the fall of the year, but we are year from this year, you know, and, because of the power crises, and all problems that we are having here in California, especially southern California, we made a commitment to do it as quickly as possible and we are doing as quickly as possible and we are asking engineers to do all our staff and our people, that we were able to accomplish this rather quickly.

All right Fred Pace chairman of board of the Metropolitan Water District Southern California thinks -- very much for you young, as we appreciate it that a just one, small part of the energy puzzle is the water. California, just 40,000 megawatts not generating power in southern California, of course, 34 million residents, here in southern California but during peak demand days, it could make a difference. Just -- just a few questions, just a few questions, just you sure you are now are we here and on site of the plant models or inside quick questions, four or web that audience.

How much do you believe that, then you have to go into perspective, at the moment, at the moment, we are talking about 13,000 homes, that is not a lot. In terms of, we see in big picture with 34 million residents in the peak demand days, it could make a very big difference. California, as the case documents, that is amount of electricity, California has and, and the point here, that is not made by the man in the blue shirt. Different is every single thing when multi cases as you get closer and closer to end of that reserve, and the 3 megawatts today, may not mean much of a difference, eventually when they reach 40,000, that could make a very big difference.

John Frank Buckley for us enjoying doesn't there revenue county, California thinks very much next hot site California energy stop open get more about that, with help of this site. Main page of California Energy Commission. You can access that site by coming to our site as

can news website and clicking on the hot sites feature.

TOUGH WORDS TODAY FROM Attorney General In its Arkansas to Oklahoma City bomber Timothy McVeigh, Arkansas' respond to McVeigh's attorneys' expected move to file a motion to delay the June 11th execution. In a statement, Arkansas' Attala and Attala has already postponed the execution date once to give McVeigh a lawyer's time to review scores of FBI documents that were never turned over during the bombing trial.

AN ALGERIAN MAN CONVICTED IN THE U.S. Pentagon was held in the state of alert -- the highest level of security. The highest alert status was set earlier not related to the terrorist bombing trial in New York, yesterday of course, four men were convicted in 1998 bombings two of U.S. Embassies in East Africa defense attorneys began arguments today against impose the death penalty in the case, two of those convicted, could be sentenced to death.

SPECIFICALLY FOUR MEN WERE

convicted in the 1998 bombings of U.S. Embassies to kill Americans. It is believed that Big Laden is in Afghanistan U.S. Government offered a five million dollar reward for information in a leads to his hideout, today, the Justice Department the author of the current news stories. Washington has produced as a evidence, linking Big Laden to embassies both -- bombings that individual spoke via telephone to group of interrogators, and the U.S. will report conference held here at Atlanta.

Qaeda Big Laden is -- was creation of United States itself, people were instigated to come to Afghanistan to fight the Soviets. In the 1980s, and other people were called heroes. By your president like Mr. Ronald Reagan and Dick Cheney, they were called heroes up -- of independence. So-called fighting their cause all of these people have been killed. And I don't know as to what is definition of terrorism on the United States. Because how can we justify trying to kill men without even giving him a fair trial, and the man who was accused of attempting to kill Big Laden without even telling us that he is a terrorist or he is accused of terrorism.

Joe: Qaeda Big Laden is one of 13 men still wanted in the bombing of the U.S. and Algerian man convicted in United States -- of plotting terrorist reportedly sold said the Los Angeles International Airport was to have been a target. "The Los Angeles Times" said al-Qaeda's leader had planned to place a large bomb at the airport.

The Newshour, (PBS, Channel 233)

Start Time: 6:01pm - Record Time: 00:54:49min

June 5, 2001

The comeback of Silvio Berlusconi in Italy. It all follows our summary of the news that Tuesday. Major funding for the *Newshour* with Jim Lehrer has been provided by: "imagine a world where we're not diminishing resources, we're growing them." Ethanol, a cleaner burning fuel made from corn. A D.M., the nature of what's to come. And by the Corporation for Public Broadcasting. This program was also made possible by contributions to your PBS stations from our members. Thank you.

From viewers like you, Tom: "Bush's proposal to key a large part of the economy to a key interest rate again today, its open market committee lowered the federal funds rate half a point to 4.75—the lowest in seven years. Bush's charge that rate on overnight loans to each other. It was up five redutes this year. In a statement, the fed said it still saw weaknesses in the economy, leaving open the possibility it might cut rates again. House Democrats today announced their alternative to President Bush's energy plan. They gathered at a gas station near the Capitol, and said they'd increase production and reduce demand. They called for federal caps on electricity prices, restrictions on drilling in Alaska, and incentives for energy-efficient cars and houses. House energy leader Gingrich said it was time to end energy

We believe we can have more than adequate supplies of energy, and save our environment at the same time if we do the right things in research on renewables, on conservation, and on new sources of energy in high technology. We do not accept the belief that this administration apparently has that we have to drill our way out of this problem.

Lehrer: President Bush is to announce his plan on Thursday. It's expected to put greater emphasis on finding more energy and building more production capacity, plus taking a new look at nuclear power. He has opposed price controls.

A runaway freight train rolled across northwest Ohio for nearly an hour today. It was unannounced as it crossed at least two counties and downtown Bowling Green at speeds of up to 45 miles per hour. Police said the southbound C.S.X. train got away while the engineer was operating a switch at a stop near Toledo. It finally slowed, and a company official managed to climb on and stop it, about 55 miles from Columbus. C.S.X. said the cargo aboard the 47-car train included a non-explosive industrial sand. No one was injured.

In the middle east today, thousands of

Palestinians protested the anniversary of Israel's founding in 1948, and fierce fighting erupted across the West Bank and Gaza. We have a report from Louise Bates of Associated Press television news.

—Reported: more than 30,000 Palestinians marched on the main square of the west bank town of Nablus in the largest demonstration against Israel seen for several years. The event was organized to mark 'Al-Naqib', meaning 'The Great Catastrophe'. That's the name Palestinians give the anniversary of the creation of the state of Israel in 1948. (Gulfire) many of the demonstrators headed to Israeli check points after the rally. When an Israeli soldier removed a Palestinian flag, he was jeered by the angry crowd. At a traffic circle near Ramallah, a regular flashpoint between the intifada, clashes with Israeli soldiers turned violent. Across the west bank and Gaza, four Palestinians were killed and more than a hundred were injured. (Gulfire)

Lehrer: since that report was filed, Palestinian doctors put the number of wounded at more than 200, and the Israeli military said an Israeli woman was killed in the west bank after nightfall. In Jerusalem today, a Palestinian bus driver was convicted of murdering eight Israelis last February. He drove his bus into a crowd near Tel Aviv. It was the single deadliest incident:

Back in this country today, more aggressive treatment of high cholesterol was proposed today by a federal medical panel. It had been convened by the National Institutes of Health. The group of experts said the change could triple the number of people who take cholesterol-lowering drugs and dramatically reduce deaths from heart disease. But they said doctors need to make it a broader concern.

make it a higher priority. There is a clear undertreatment of people who need cholesterol-lowering. That is a chronic problem. We have put out guidelines and information and said that this deserves aggressive attention, and we have to do more to make it easy to implement all of these guidelines and make it possible to apply them in actual

Lohrer: It's estimated more than 50 million Americans have high cholesterol. The new guidelines recommend different tests to screen for the problem. They also revise the recommended levels for good and bad cholesterol. We'll have more on this story later in the program tonight. Married couples with

One week since terrorist attacks destroyed the World Trade Center and damaged the Pentagon and hope for finding survivors in the rubble is fading. Tonight, the latest on the investigation and plans for a formal investigation is Chris Matthews. Welcome to a special edition of "Hardball." Captioning by the national captioning service - www.nccap.org. 3,422 people are still missing in the rubble of the World Trade Center and New York Mayor Rudolph Giuliani doesn't expect anymore survivors.

The chances of recovering any live human beings are very, very slim. Given the amount of debris and the condition of the site, those chances are not totally, however, ended or over, so, we will - we will still conduct ourselves as a rescue effort as well as a recovery effort.

Today, the nation aaged at 48 hrs. morning, the time the first plane hit to mark the tragic events of a week ago [screws]

At the White House, President Bush pressed forward, calling for tough terrorism and hating the American people.

Today, I herald the soul and spirit of America with five examples of people who've made a huge difference and those who suffer and those who help. This is a great land and it's a great land because our people are so diverse and strong and compassionate.

Meanwhile, Attorney General John Ashcroft says detainees will be held for as long as 60 days. Some 1,000 people have been detained. So far, at least 75 people have been detained and questioned about the attacks and four arrested on material witness. Among those detained are two men who were carrying hot cutters and large amounts of cash who were pulled off a train in Texas. And a man detained in Minnesota prior to the attack who aroused suspicion for trying to buy time on a jet under the pretense of a medical emergency. In Afghanistan, refugees continue to pour out of the country, expecting a U.S. attack. Afghanistan's ruling Taliban says it hasn't ruled out a possible peace deal with the Northern Alliance, which was behind last week's attacks. But it wants proof before it hands over Bin Laden. Even so, Defense Secretary Donald Rumsfeld says the surrender may be imminent.

Our adversaries are not one or two terrorist leaders, even a single terrorist organization or network. It's a broad network of individuals and organizations that are determined to terrify and, in so doing, to deny us the very essence of

what we are - free people.

That hour, we're going to get reaction from former Senator Warren Rudman, plus we'll go on or off the air with game show host Harry McAlerney and novelist Kari. And talk to David Marr on how President Bush is handling this crisis and we began this hour at ground zero with NBC's Chip Read. Here's news today, right?

Well, absolutely, Chris. This is the ninth day in which they have not pulled aside single live persons out of that rubble. You can see over my shoulder it is still burning intensely. The smoke is pouring out of there. The conditions for the rescue workers are still terrible and they are now through an agonizing process, officials are, at trying to decide at what point do you just decide this is no longer a rescue effort where you're looking for people alive and it becomes a recovery effort where you're simply looking for bodies? Some officials think it's better to declare, at some point, it's over. So think it's better to just let the families come to the site and grieve. That's what happened today and that there is a very, very small chance of finding people alive in there. At the same time, he said there is still a rescue effort. He does not want to squelch that rescue effort, but on the other hand, there is a family that comes to the conclusion that the chances of finding their loved ones in there alive are very, very slim indeed. One of the people that died today, Rudy Goulet, was an elderly man, the 91-year-old man pleading with the police not to come down here because they have been coming down in deus to take pictures, see the site. Maybe it is part of the American spirit to grieve and to grieve generally, but it is a interference with the part of the rescue workers in there. They want this site to be kept open so that the vehicles carrying bodies and equipment in and out will not be impeded by people who are not there to help.

Thank you very much. NBC's Chip Read at ground zero. For the latest on the plans of a possible military strike, we'll have a report from NBC's Jim Akers back at the Pentagon. U.S. Marines drawed for combat leave their base in Okinawa today. The Army's 82nd Airborne at Fort Bragg, North Carolina. They play a major role in any U.S. invasion of Afghanistan.

They're walking for a call to arms. And they're ready to go and answer it. Donald Rumsfeld says when it comes to Afghanistan's anti-aircraft, all options are on the
